

Portfolio Backtest Evidence: 1997-2026

Net USD evidence for every current portfolio output, regional index benchmarks, and an independent point-in-time index challenger.

The long-history portfolio results are retrospective holdings replays, not point-in-time stock-selection backtests. Use them for exposure and path diagnostics, not as evidence that the current model could have selected these names in 1997.

13 portfolio outputs tested	29.6 requested historical years	\$186,060,522 current-derived starting NAV	2013-09-30 common 80% investable start	25 separate reconstructed PIT months
19 standalone benchmark paths	13 source-backed macro-event windows			

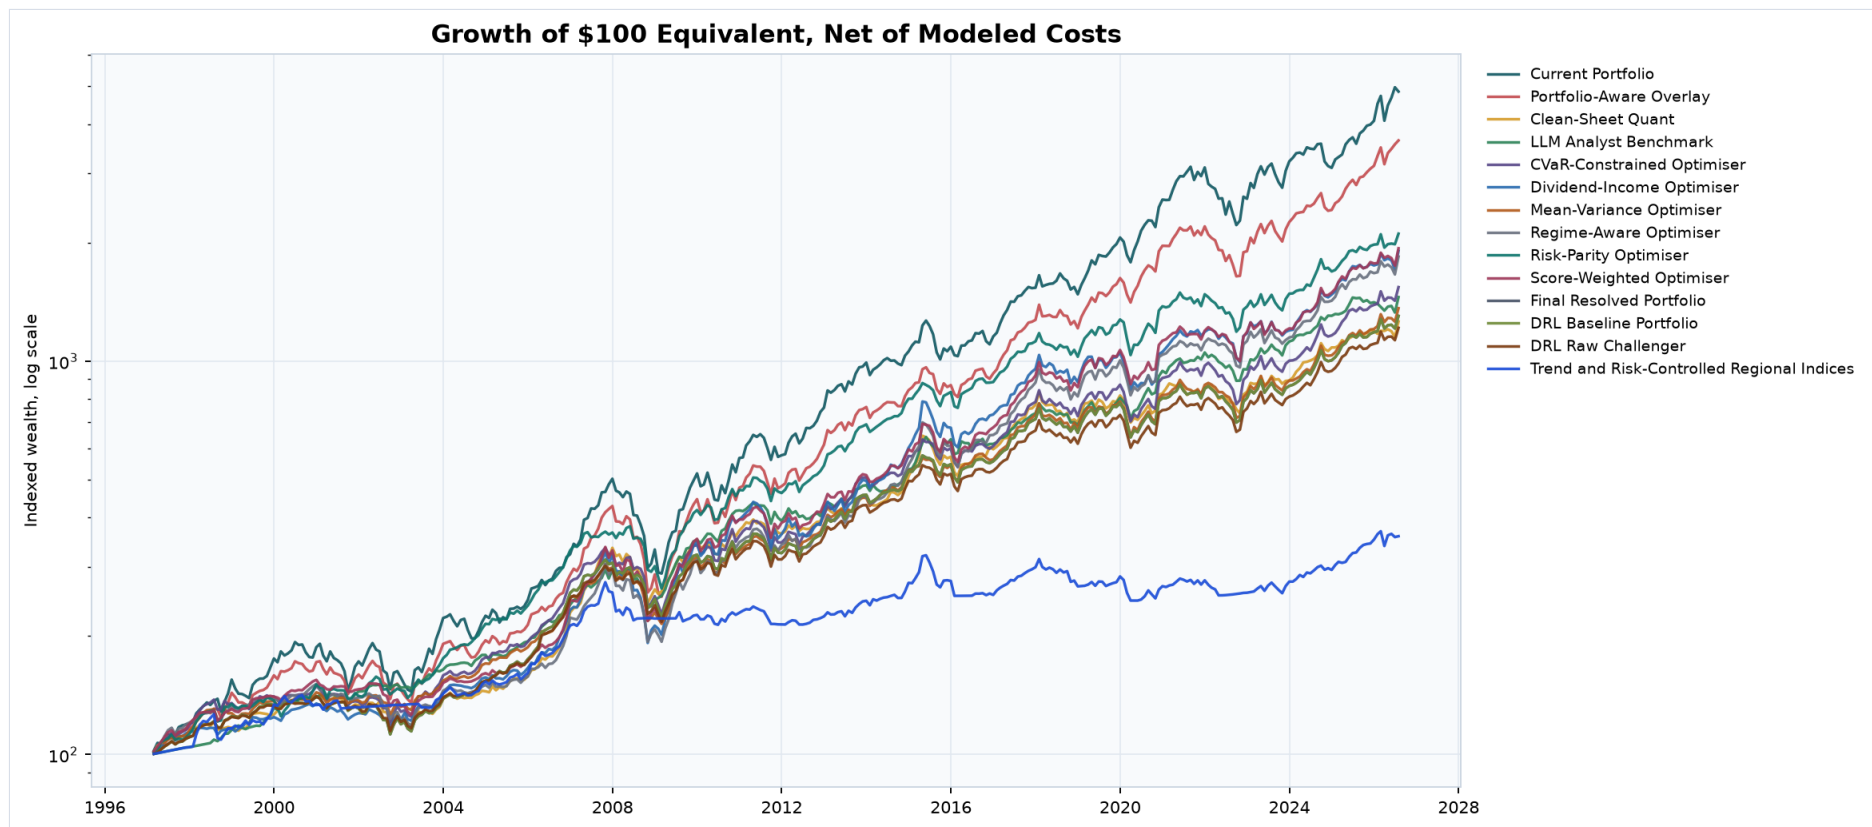

The test covers 29.6 years and 13 portfolio outputs. The current portfolio starts at \$186,060,522 and finishes at \$9,013,105,522 after modeled costs, a net PnL of \$8,827,045,000. On the common investable window, Portfolio-Aware Overlay has the highest Sharpe ratio at 0.88. The long results replay securities selected with today's information, so they describe exposure and path behavior rather than proving historical selection skill.

Executive Comparison

Trend and Risk-Controlled Regional Indices	\$100,000	4.43%	8.61%	0.30	-23.30%	\$358,822	\$258,822

The performance table converts each assigned starting balance into a fully net ending balance. CAGR is the smooth annual growth rate, volatility measures return variation, Sharpe compares excess return with total variability, and maximum drawdown is the deepest peak-to-trough loss. Current Portfolio records the highest common-window CAGR at 14.20% alongside a -28.91% maximum drawdown.

Indexed growth uses each portfolio's assigned capital only for PnL; this chart rebases every series to 100 for comparability.

DAX Performance Index	8.18%	0.42	0.45	0.65	0.22	-36.98%	8.02%	10.99%			

Portfolio or index	cagr	sharpe	Lo Sharpe	sortino	calmar	Max drawdown	Monthly VaR 5%	Monthly ES 5%	PSR	MinTRL months	DSR
Trend and Risk-Controlled Regional Indices	3.53%	0.23	0.22	0.33	0.15	-23.30%	4.19%	6.42%	93.87%	401.646	67.58%
FTSE 100 Index	3.06%	0.16	0.18	0.22	0.08	-38.76%	6.72%	9.76%			

Sharpe uses all volatility; Lo-adjusted Sharpe allows for serially related monthly returns; Sortino counts downside variability; and Calmar divides CAGR by maximum drawdown. Monthly VaR is the 5% loss threshold, while expected shortfall is the average loss beyond it. PSR measures confidence that Sharpe clears a hurdle, MinTRL estimates the required history, and DSR discounts non-normal returns and multiple trials. SPDR S&P 500 ETF adjusted-close proxy has the strongest Lo-adjusted Sharpe at 1.21.

Annual Fee Assumption

Charge	Annual rate	Basis points	Assessment month	Reference AUM	Bank charge	Calculated charge	Difference	Benchmarks charged
Annual bank custody and AUM charge	0.25%	25.000	12	\$186,060,522	\$465,151	\$465,151	\$0	False

The bank charge is 25 basis points, assessed once in month 12 on then-current AUM. At reference AUM of \$186,060,522, the configured and calculated charges equal \$465,151 and differ by \$0. The same percentage, not the full reference-dollar amount, applies to each portfolio; external benchmarks remain unchanged.

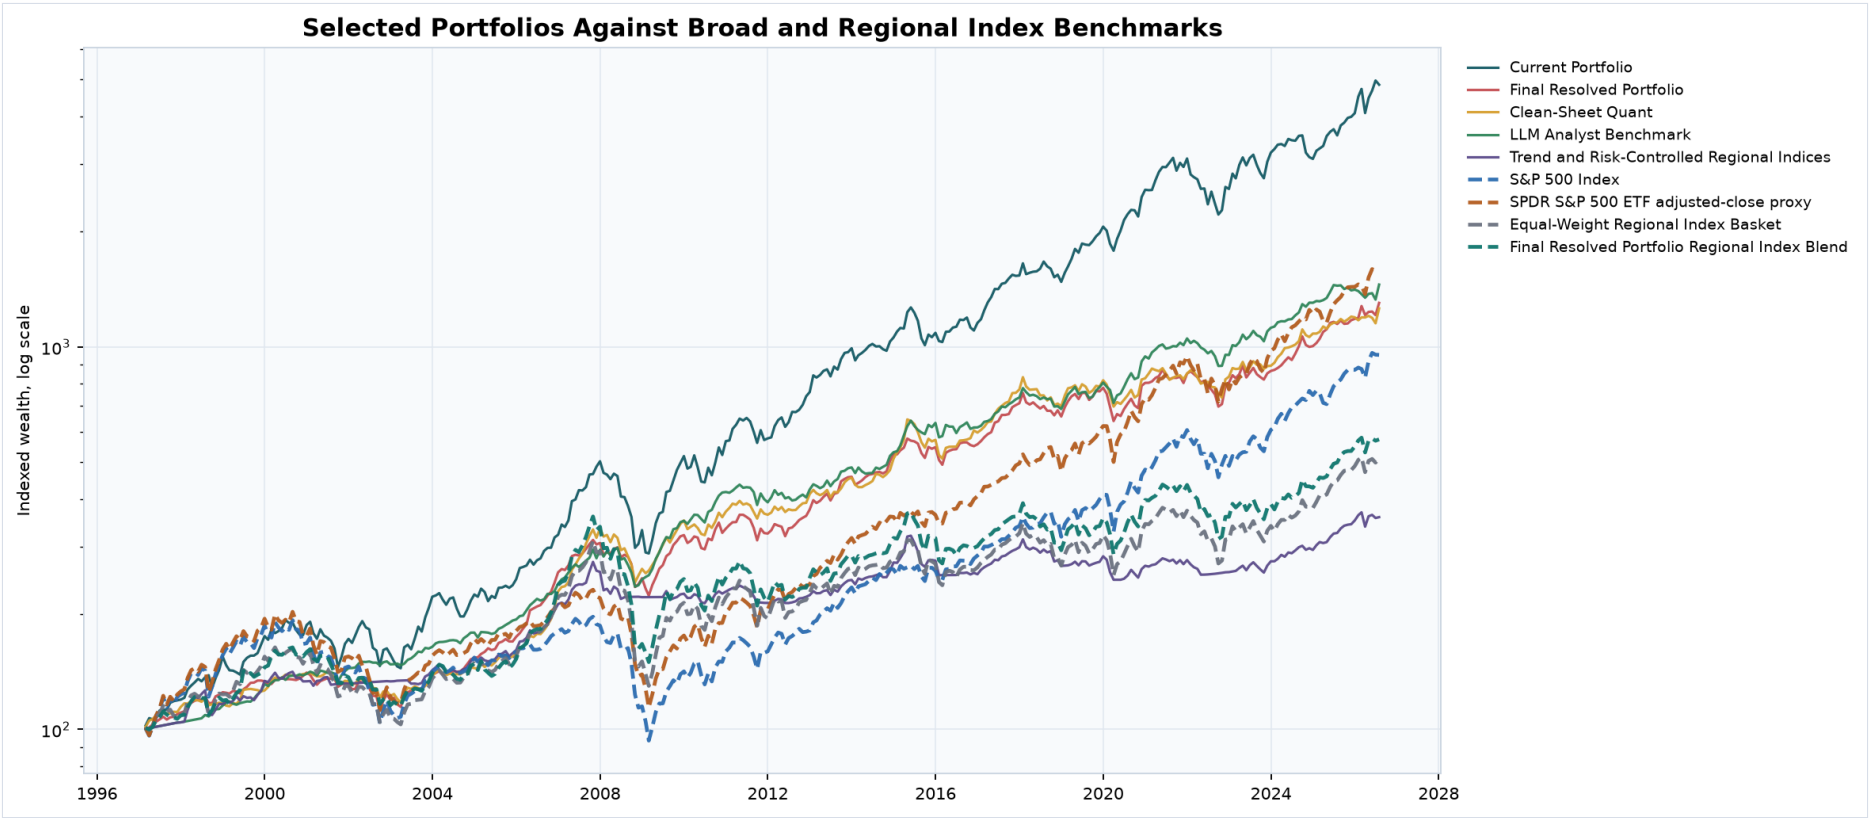

Fee Impact by Portfolio

Portfolio	Trading costs	Bank fees paid	Total modeled costs	Annual assessments	Ending value before fee	Ending value after fee	Ending-value fee drag	Effective fee bps

Shanghai Composite Index	3.98%	20.89%	0.20	-51.25%	\$165,543
FTSE 100 Index	3.06%	15.33%	0.16	-38.76%	\$147,582
FTSE 250 Index	2.79%	19.32%	0.15	-42.31%	\$142,755
Hang Seng Index	1.28%	20.58%	0.07	-55.51%	\$117,789

Each standalone index is converted to USD and replayed as an uncharged buy-and-hold reference on \$100,000. Price-index and total-return conventions differ, so these are broad path comparisons rather than perfectly dividend-consistent alpha tests. Nasdaq Composite Index has the highest common-window CAGR at 16.35%.

Risk-Parity Optimiser	Risk-Parity Optimiser Regional Index Blend	3.84%	0.74	0.069	0.24	28.73%	\$75,412

Each portfolio is compared with an index blend matching its regional weights. Alpha is annualized return not explained by beta, tracking error is active-return volatility, and information ratio is active return per unit of tracking error. Portfolio-Aware Overlay has the highest information ratio at 1.04 and relative PnL of \$596,268,264.

This table groups non-contiguous months by the lagged 3-month Treasury-bill yield level and annualizes the observations in each group. It is a conditional description, not a continuous investable path or a causal estimate. For Final Resolved Portfolio, the strongest group is High ($\geq 4\%$), with a conditional geometric return of 15.77% across 105 months.

This table groups non-contiguous months by the prior 12-month change in the Treasury-bill yield and annualizes the observations in each group. It is a conditional description, not a continuous investable path or a causal estimate. For Final Resolved Portfolio, the strongest group is Rising, with a conditional geometric return of 13.03% across 79 months.

Lagged Market Regime Performance

2026 US-Iran war shock	S&P 500 Index	3	3.89%	-5.92%	-0.051	\$882,649	\$34,342

Event return compounds all overlapping monthly observations, event drawdown measures the loss within that window, and event PnL applies the return to actual simulated AUM at the start of the window. The weakest configured event for the final portfolio is COVID-19 market crash, returning -12.58% with a -15.19% within-window drawdown.

The Three Backtests

1. Historical / walk-forward

Monthly execution with one-period signal lag for the index challenger.
Current portfolio outputs are shown only as retrospective holdings replays
and are explicitly flagged for selection look-ahead and survivorship bias.

2. Resampling

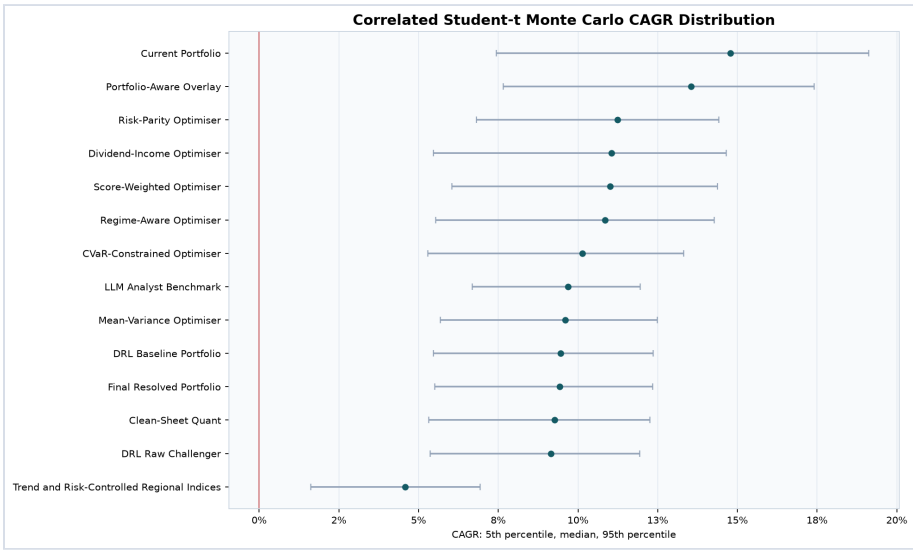

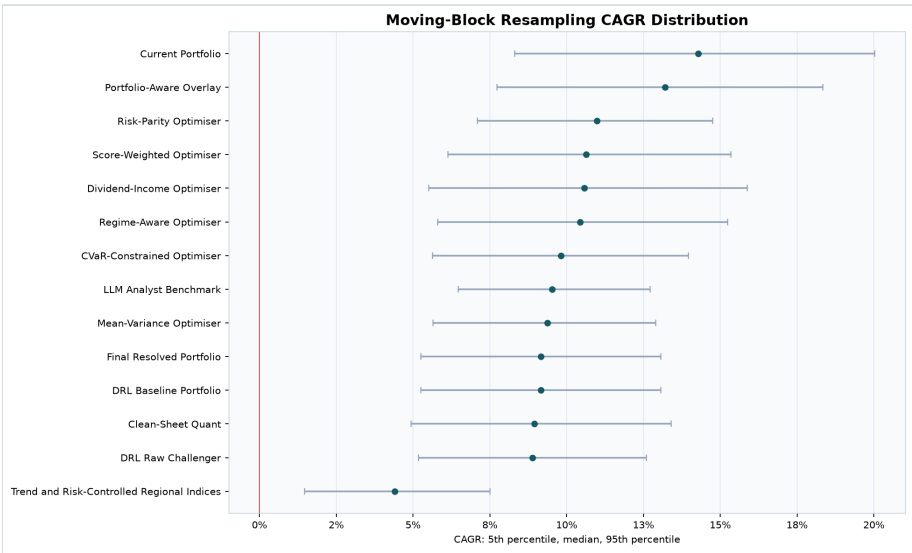

Circular 12-month moving blocks preserve serial dependence and cross-strategy alignment. The intervals show how path order changes CAGR, Sharpe, drawdown, and benchmark outperformance.

3. Monte Carlo

A correlated Student-t AR(1) process with EWMA conditional variance preserves cross-portfolio dependence, autocorrelation, fat tails, and volatility clustering without fitting a return target.

Statistical integrity

PSR, MinTRL, Sidak family-wise control, and Deflated Sharpe Ratios account for sample length, non-normal returns, and the number and correlation of portfolio trials.

Moving-Block Resampling Summary

Portfolio	cagr_p05	cagr_median	cagr_p95	Drawdown 5th percentile	Loss probability	Regional outperformance
current_portfolio	8.31%	14.27%	20.02%	-57.20%	0.00%	100.00%

Monte Carlo uses correlated Student-t shocks, AR(1) persistence, and EWMA volatility to create fat-tailed, volatility-clustered paths. It is a modeled stress distribution, not a forecast promise. The lowest simulated 5th-percentile CAGR is trend_risk_controlled_indices at 1.63%.

Untouched Embargo Comparison

Portfolio	Sample	Months	cagr	Volatility	sharpe	Max drawdown
clean_sheet	development	318	8.72%	10.89%	0.65	-27.73%

optimised_cvar_constrained	development	318	9.15%	12.28%	0.62	-32.27%
optimised_cvar_constrained	untouched_embargo	36	14.89%	11.08%	0.92	-7.55%
optimised_dividend_income	development	318	10.03%	14.36%	0.60	-41.29%
optimised_dividend_income	untouched_embargo	36	14.82%	11.90%	0.86	-8.73%
optimised_mean_variance	development	318	8.68%	11.07%	0.64	-29.60%
optimised_mean_variance	untouched_embargo	36	14.49%	10.50%	0.93	-7.24%
optimised_regime_aware	development	318	9.82%	13.24%	0.63	-36.59%
optimised_regime_aware	untouched_embargo	36	15.49%	11.38%	0.94	-7.47%
optimised_risk_parity	development	318	10.69%	11.58%	0.77	-30.56%
optimised_risk_parity	untouched_embargo	36	12.67%	11.30%	0.73	-8.71%

Portfolio	Sample	Months	cagr	Volatility	sharpe	Max drawdown
optimised_score_weighted	development	318	10.02%	12.84%	0.66	-35.52%
optimised_score_weighted	untouched_embargo	36	15.51%	11.42%	0.94	-7.29%
portfolio_aware_overlay	development	318	12.51%	14.60%	0.75	-41.21%
portfolio_aware_overlay	untouched_embargo	36	17.00%	12.95%	0.94	-11.35%
trend_risk_controlled_indices	development	318	3.87%	8.61%	0.26	-23.30%
trend_risk_controlled_indices	untouched_embargo	36	9.48%	8.63%	0.59	-8.26%

The embargo table compares the development sample with the final untouched 36 months. A sharp fall in Sharpe or return signals instability; agreement is encouraging but cannot cure retrospective selection bias.

Statistical Significance and Multiple Testing

Portfolio	annualised_sharpe	PSR	MinTRL months	sidak_significant	DSR	cluster_adjusted_deflated_sharpe_ratio
llm_benchmark	0.81	100.00%	53.898	True	99.92%	99.99%

final_portfolio	0.65	99.97%	83.862	True	98.92%	99.79%

Portfolio	annualised_sharpe	PSR	MinTRL months	sidak_significant	DSR	cluster_adjusted_deflated_sharpe_ratio
drl_baseline	0.65	99.97%	83.862	True	98.92%	99.79%
optimised_cvar_constrained	0.65	99.96%	84.416	True	98.91%	99.78%
optimised_dividend_income	0.63	99.96%	85.356	True	98.75%	99.76%
trend_risk_controlled_indices	0.30	93.87%	401.646	False	67.58%	84.38%

PSR and MinTRL evaluate reliability, Sidak controls family-wise error across tested strategies, and DSR penalizes multiple trials and non-normal returns. 13 of 14 results clear Sidak; significance does not remove retrospective selection look-ahead.

Data Quality and Causality

Execution and Liquidity

Portfolio	Total modeled cost	Annual turnover	Max ADV participation	Constrained trade events	Max unfilled target
current_portfolio	\$188,405,153	17.52%	5.00%	1645	27.56%
portfolio_aware_overlay	\$167,507,440	23.94%	5.00%	1714	25.32%
final_portfolio	\$83,637,346	21.63%	5.00%	2332	37.65%
drl_baseline	\$83,637,346	21.63%	5.00%	2332	37.65%
drl_challenger_raw	\$78,761,389	21.62%	5.00%	3218	33.86%
optimised_risk_parity	\$61,615	27.98%	5.00%	1	0.81%
optimised_dividend_income	\$52,785	30.88%	5.00%	10	0.53%
optimised_score_weighted	\$52,306	28.98%	5.00%	10	0.47%
optimised_regime_aware	\$49,074	29.43%	5.00%	10	0.46%
llm_benchmark	\$45,544	24.15%	5.00%	61	4.42%

Portfolio	Total modeled cost	Annual turnover	Max ADV participation	Constrained trade events	Max unfilled target
optimised_cvar_constrained	\$45,242	29.32%	5.00%	2	0.91%
optimised_mean_variance	\$40,686	27.13%	5.00%	5	4.42%
clean_sheet	\$39,945	25.90%	5.00%	11	4.04%
trend_risk_controlled_indices	\$28,265	126.60%		0	0.00%

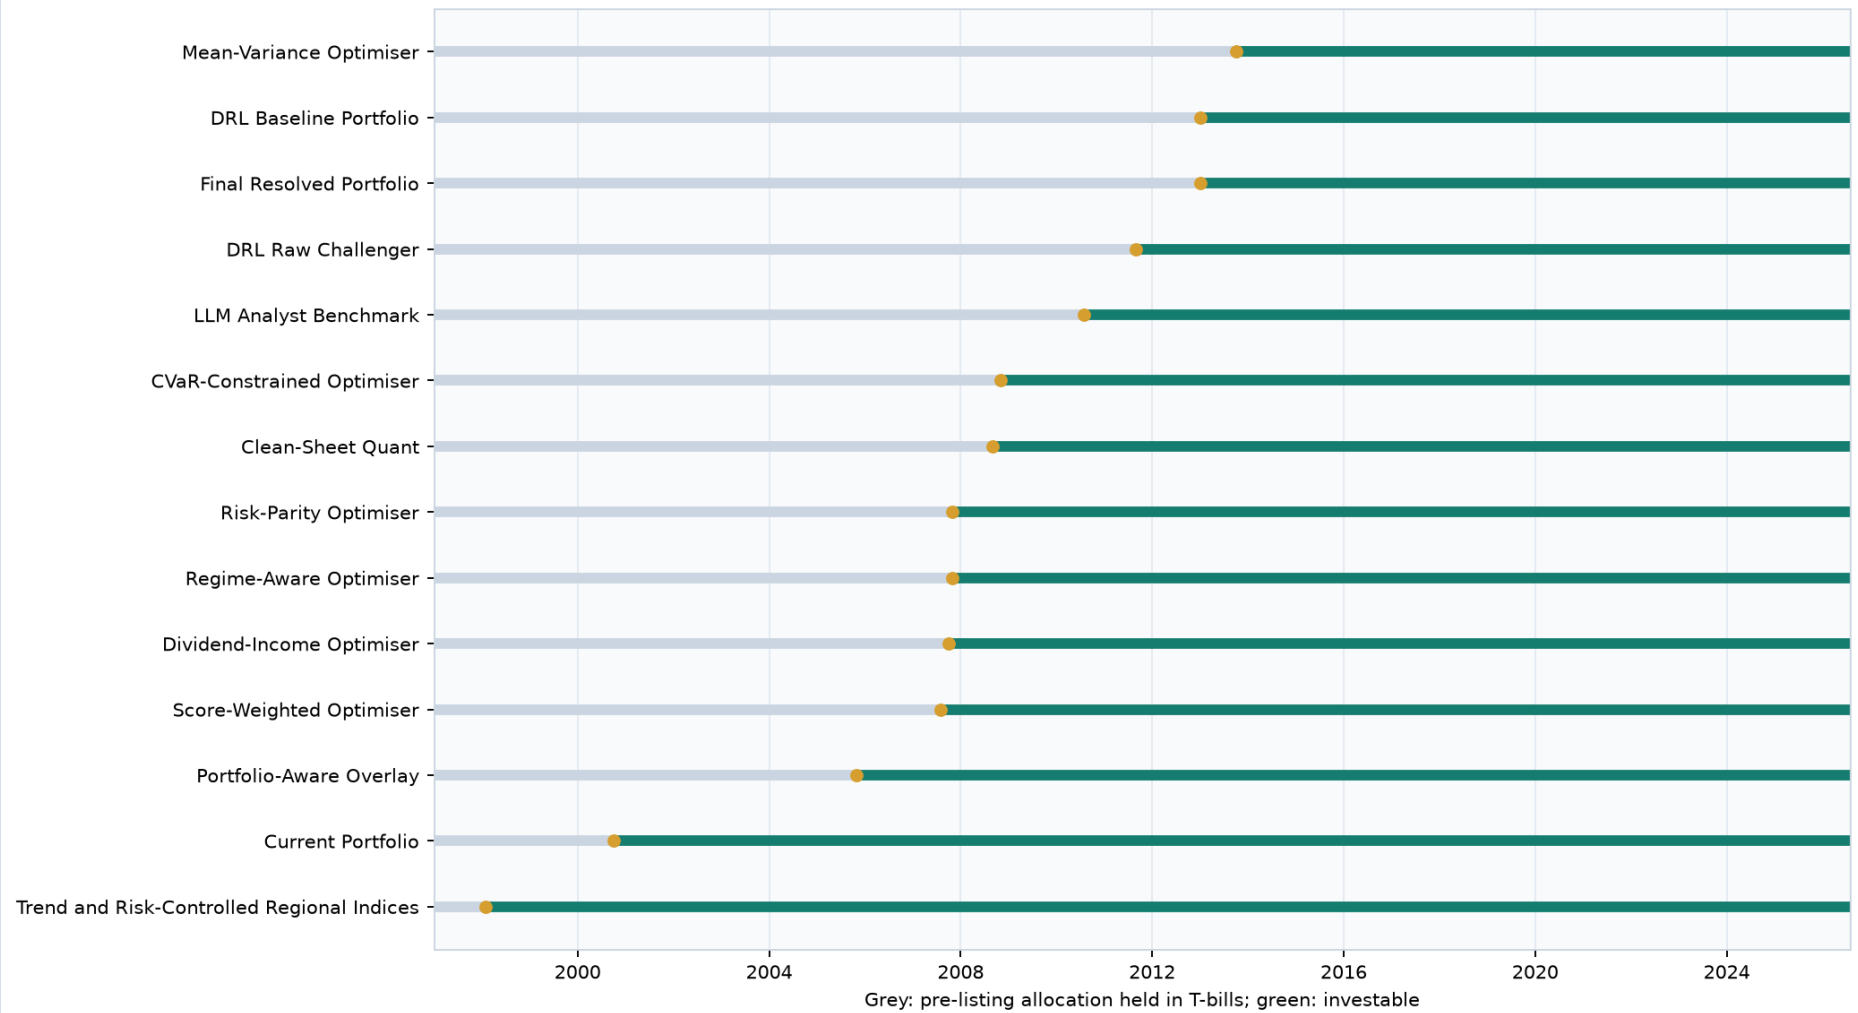

Execution rows show dollar costs, turnover, peak ADV participation, constrained trades, and unfilled weight. Large current-derived AUM can leave low-liquidity targets partly in cash, making these results capacity-aware.

Adjusted-Price Repairs

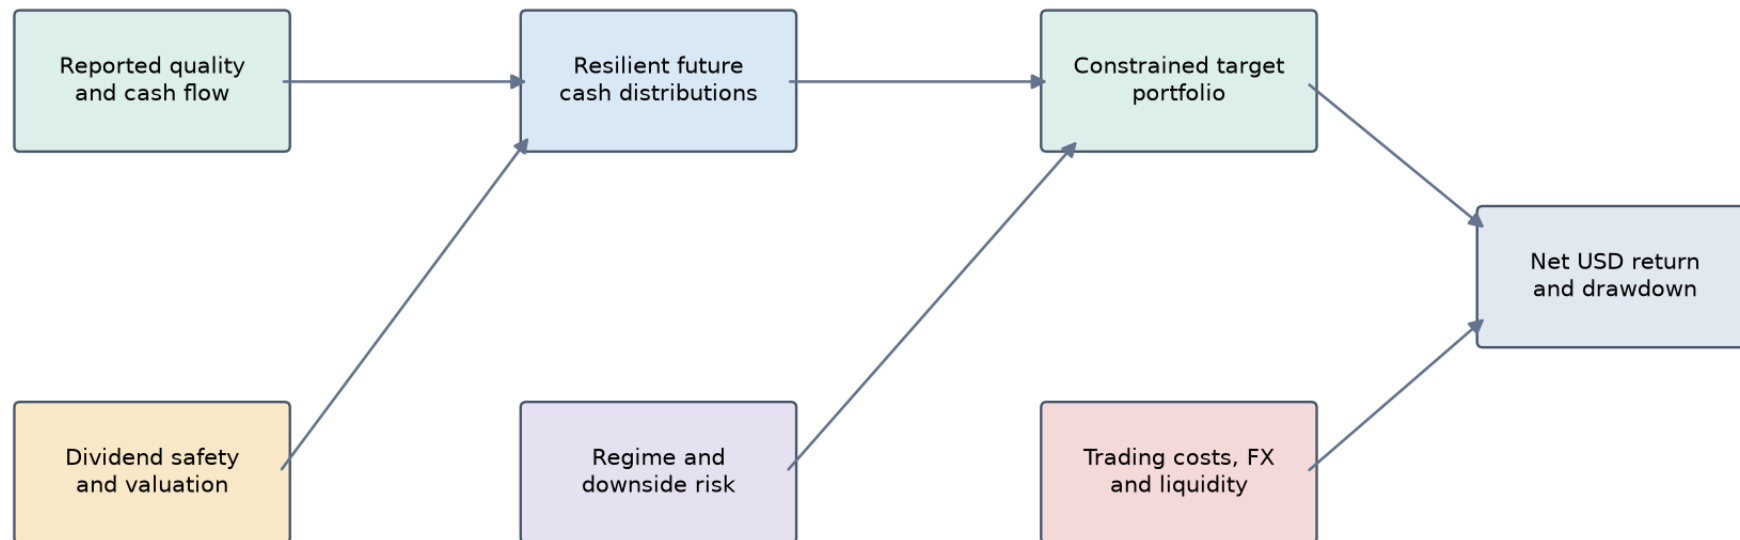

symbol	Event date	Auditable repair	Raw return	Post-repair return	Scale factor
600018.SS	2006-10-26 00:00:00	persistent_level_shift_historical_rescale	-76.85%	0.00%	0.232
GEBN.SW	1999-06-22 00:00:00	persistent_level_shift_historical_rescale	-58.96%	0.00%	0.410
SHEL.L	1997-07-01 00:00:00	persistent_level_shift_historical_rescale	-71.74%	0.00%	0.283
TTE.PA	2005-12-26 00:00:00	isolated_spike_log_interpolation	300.00%	-0.16%	0.250
ULVR.L	1997-08-26 00:00:00	persistent_level_shift_historical_rescale	322.53%	0.00%	4.225
ULVR.L	1997-10-13 00:00:00	persistent_level_shift_historical_rescale	83.68%	0.00%	1.837

The adjusted-price process made 6 explicit repairs. Each row records the raw move, rule, repaired return, and scale factor so provider anomalies remain auditable.

When at Least 80% of Each Intended Asset Allocation Was Tradable

Causal Theory Tested by the Model and Degraded by Execution Frictions

Bias and Limitation Register

category	severity	applies_to	status	treatment
selection look-ahead	CRITICAL	all current portfolio-output replays	ACKNOWLEDGED	Labelled retrospective holdings replay; excluded from claims of 1997 model selection skill.
survivorship bias	CRITICAL	current selected securities	ACKNOWLEDGED	Pre-listing capital stays in T-bills; current holdings are never presented as a historical universe.
	HIGH	full stock-selection strategy	SEPARATED	

category	severity	applies_to	status	treatment
point-in-time model evidence				The 25-month reconstructed decision history is reported separately and never spliced into the long replay.
corporate actions	MEDIUM	holding histories	MODELED	Yahoo adjusted closes include splits and distributions where provider history supports them.
currency conversion	MEDIUM	non-USD holdings and indices	MODELED	Historical FRED FX converts local adjusted closes to USD; ECU bridges pre-euro observations.
benchmark dividend consistency	MEDIUM	regional price indices	WARNING	DAX is a performance index; other regional index series may omit dividends. SPY is included as a total-return proxy.
transaction costs and liquidity	MEDIUM	portfolio outputs and index challenger	MODELED	Commission, spread, slippage, square-root impact, missing-ADV penalty, and 5% ADV caps are reported.
annual bank AUM charge	MEDIUM	portfolio outputs and index challenger	MODELED	A 25 bp charge is deducted once each December from then-current AUM; external benchmarks remain uncharged references.
conditional regime analysis	MEDIUM	rate, market, and recession tables	DESCRIPTIVE	Rate and market inputs are lagged one month; NBER recession labels are retrospective and are not presented as tradable signals.
macro-event windows	MEDIUM	event comparisons and shaded plots	DESCRIPTIVE	Configured market-response windows overlap monthly returns and do not assert legal conflict dates or isolate causal effects.
short-sale constraints	LOW	all tested portfolios	NOT_APPLICABLE	Every tested allocation is long-only; no borrow availability or fee assumption is required.
multiple testing	HIGH	portfolio comparison	CONTROLLED	Sidak FWER and Deflated Sharpe Ratios use both actual and correlation-clustered trial counts.
non-stationarity	HIGH	all historical and simulated evidence	RESIDUAL_RISK	Embargo, subperiod plots, block resampling, fat tails, and EWMA volatility expose but cannot remove structural breaks.

The limitation register distinguishes modeled, controlled, separated, and unresolved risks. The critical issue is that current holdings survived long enough to be selected today, so the 1997 replay cannot prove selection skill.

Point-in-Time Model Evidence

The repository's reconstructed model walk-forward is not spliced into the 1997 holdings replay. It remains a separate, shorter evidence set because it uses dated model decisions and realised outcomes.

strategy	observations	annualised_return	annualised_volatility	sharpe	maximum_drawdown	annualised_cost_drag	evidence_mode
wolf_cvar	25	18.93%	10.84%	1.75	-5.85%	0.025	reconstructed_pit_proxy
equal_weight_eligible	25	24.99%	11.29%	2.21	-5.17%	0.006	reconstructed_pit_proxy
cap_weight_eligible	25	17.62%	8.88%	1.98	-3.99%	0.006	reconstructed_pit_proxy

The point-in-time table contains 25 dated decision months and remains separate from the long holdings replay. It is the more relevant evidence for decisions made with contemporaneous data.

Research evidence only. The paper used as the methodological specification is *The Three Types of Backtests* (Joubert, Sestovic, Barziy, Distaso, and Lopez de Prado, 29 July 2024). Raw Yahoo Finance and FRED histories remain outside Git; compact outputs, manifests, and checksums are included.
